12. There may have been another related group that struck north towards the Levant. It is unclear if this group made a separate crossing from Africa via the Sinai or split from the original band soon after the first crossing.
13. We have learnt a lot in recent decades about the early migrations of modern humans from archaeology and genetic data. However, it is still an evolving area of research, and there is a confusing and, sometimes, contradictory array of research. For a good survey of the material read *The Incredible Human Journey*, Alice Roberts. Bloomsbury, 2009; *Out of Eden: Peopling of the World*, Stephen Oppenheimer. C&R, 2003.
14. *The Circulation of the Persian Gulf*, J. Kampf and M. Sadrinasab, Ocean Science Discussions, 2005. http://www.ocean-scidiscuss.net/2/129/2005/osd-2-129-2005
15. There is controversial new research that, during this period, modern humans may have even mated with Neanderthals. The Neanderthals were a closely related but parallel species and it was long considered that they left behind no descendants. However, new research by Harvard Medical School and the University of California, Santa Cruz, suggests that they have left behind tiny traces of their genes amongst us. While I am not entirely convinced by the study, it is strange to think that many of us may not be 'pure' modern humans! See: http://www.newscientist.com/article/dn18869-neanderthal-genome-reveals-interbreeding-with-humans.xhtml?full=true

23. Readers should recognize that genetics is a young science and still evolving. In addition, subsequent migrations have obscured many of the markers of the original migrations. Therefore, the schematic framewords discussed in this section is at best a broad description. The reality would have been far more messy, with groups and sub-groups going back and forth and interbreeding with yet other groups.
24. 'Polarity and Temporality of High-Resolution Y-Chromosome Distributions in India Identify Both Indigenous and Exogenous Expansions and Reveal Minor Genetic Influence of Central Asian Pastoralists', Sengupta et al, *The American Journal of Human Genetics*, February 2006.
25. 'Reconstructing Indian Population History', David Reich et al., *Nature*, September 2009.
26. Geneticist Thangarajan, one of the co-authors of the study, said in a press interview that the ASI group may date to 60,000 years ago and the ANI to 40,000. So, we are dealing with very old populations.
27. The genetic sub-groups are named by adding letters or alphabets to a lineage. So, R1a1 is a subgroup derived from R1a that in turn is derived from R1 and so on.
