

In his quest to get targeted yields, Mr. Bharat Taware had been forced to use ever more water, fertilisers, and electricity. To put it simply, he has been spending ever-increasing sums of money on land that is producing lesser over time. In doing so, he is further compromising the fertility of his farm.

Mr. Bharat Taware's story is not unique. Farmers across India are increasingly having to grapple with stressed crops and sub optimal harvests. A disruption in weather patterns driven by climate change is further dampening their prospects and increasing the risk for farmers

India's farmers sustain India's 130 crore people, while Agriculture and its associated sectors are also the largest sources of livelihoods in the country.

Yet, according to the Food and Agriculture Organisation(FAO), agriculture's share of GDP has steadily declined from 1951 to 2011.

Part of that is due to increased industrialisation but a large part is also down to declining field output..

Like Shri Bharat Taware's farm, Indian agriculture has been far too resource-intensive for far too long. Instances of overstressed water resources, desertification, and land degradation are growing increasingly common.

But a few companies are working on solutions to arrest this trend. Some, like us at UPL, are engaged on the technology front, harnessing the power of mechanization and digitalized connected technology to boost farm prosperity.

At UPL, we are also actively developing environment-friendly crop solutions aimed at boosting the productivity of India's farmlands while putting them back on a sustainable footing.

One of the company's key offerings in realizing this vision is the Zeba Technology.

Zeba is a naturally derived, starch-based, super absorbent technology. Intended for in-furrow application,
