"Water is life, our faith and also a stream of developmental flow. The vision of Aatmanirbhar Bharat significantly depends on our water resources and connectivity. I believe that with public participation and collective efforts, we will conserve water and further strengthen our rain water management to build our Nation's shining tomorrow."

- Narendra Modi

Haryana puts premium on water conservation

Overarching policy bets big on use of treated waste water

If there is water, there is life. Water, rightly called the elixir of life by Dr. C V Raman, is the most important natural resource on the earth to sustain all forms of life. Given its paramount importance and the hard and harsh reality that it is a limited resource, water needs to be used judiciously.

This hypothesis gets doubly underscored in the context of Haryana where nearly 60 percent of the ground water is brackish and unfit for human consumption. Conscious of the grave reality and great need to address the issues of limited availability of water resources and the quality of water, the Manohar Lal Government has come out with an overarching policy on water conservation with emphasis on reuse of the treated water.

The message woven into the fabric of the policy is loud and clear: mere conservation efforts won't do, we need to treat used water and recycle it for use again at least for non-potable purposes. It aims at maximizing collection of sewage and its treatment, and increasing reuse of the treated water for non-potable applications to reduce dependency on the limited ground and surface

"Water is a precious resource and the Haryana Government is committed to conservation, preservation and demand management for future generations of Haryanavis. Guided by the vision of the Prime Minister, Sh. Narendra Modi, we are making best possible efforts to optimise utilisation of water resources, promote use of treated water, set up rain water harvesting structures and adopt ground water recharging techniques."

- Manohar Lal
