

The modern distribution of population groups with the Y chromosome Haplogroup R1a1a supporting the 'out of the Eurasian steppes' theory. (Adapted by Hxseek from Underhill et al, 2009).

All these carriers share a common male ancestry, which leads to the question: where did this Haplogroup R1a1a originate?

According to the latest research, the most likely explanation is that Haplogroup R1a1a mutated out of Haplogroup R1a in the Eurasian steppe about fourteen thousand years ago.[14] This is a crucial piece of evidence in support of the 'out of the Eurasian steppe' theory, which argues that this is where a Proto-Indo-European language first began to be spoken, making it the *Urheimat*, or 'original homeland', of the Indo-European language family. About ten thousand years ago significant numbers of this Subclade
