# INTELLIGENTLY YOURS TRULY

> **The recipe of making generative AI is very simple... you need three ingredients... data, the knowhow to train the data and you need humongous computing power**
>
> **This is an exciting and potentially scary technology... even the best scholar does not 100 per cent understand where this technology is going, what is the limitation... my answer is democratising the process**

## KEY TAKEAWAYS

- Open source is key towards transparency, accountability in emerging tech like generative AI
- This will help users understand how AI models are trained
- Fields like education or healthcare are low-hanging fruit for AI tech in India

**Visual art by Artificial Intelligence (AI)?** Over the past few months, that's the idea of creative expression which has had people hooked. Driving this are text-to-images generative AI models—simply put, these consist of algorithms that generate images based on a text prompt given by the user. One such algorithm is Stable Diffusion, developed by the Machine Vision & Learning Group at Ludwig Maximilian University of Munich in collaboration with UK-based start-up Stability AI. But unlike most generative AI models whose technology is proprietary, Stable Diffusion aims to recreate what the Linux project did for open-source software in the 1990s.

The new version Stable Diffusion 2.0 was released in November 2022 and within a month of its release, says Stability AI, four of the top 10 applications on Apple's App Store were powered by the AI model.

Stable Diffusion is counting on the wider community of engineers and research hubs across the world to help improve it. "Open-source means transparency," said Ren Ito, Chief Operating Officer at Stability AI.

Ito explains that cultural biases often crop up in how generative AI models render text into images. "So, there is potentially a global one-size-fits-all model created by the huge corporations but there is also potential that every culture, every country, ethnicity can choose and build their own foundation model which is another crucial thing."

The key part, he says, is to democratise the process. ■
