METHODOLOGY

The India Today Mood of the Nation (MOTN) poll was conducted by CVoter, a globally renowned name in the field of socio-economic research, between December 20, 2021, and January 10, 2022, interviewing 39,575 respondents covering all Lok Sabha segments across all states. Apart from these samples, additional 20,566 interviews from CVoter's regular tracker data between August 16, 2021, and January 10, 2022, was also analysed for the long-term trendline. Thus, the opinion of a total of 60,141 respondents was considered for this MOTN report. The margin of error is +/- 3 per cent at macro level and +/- 5 per cent at micro level of reporting with 95 per cent confidence level.

From May 2009 onwards, the CVoter Tracker has been conducted each week, resulting in 52 waves in a calendar year, in 11 national languages, across all states and UTs in India, with a target sample size of 30,000 each quarter. The average response rate is 55 per cent. Starting January 1, 2019, CVoter has been carrying the tracker on a daily basis, using the rollover sample of seven days for tracker analysis.

All these polls are based on a random probability sample as used in the globally standardised methodology, carried out by trained researchers across all geographic and demographic segments. This survey is based on CATI interviews of adult respondents across all segments. Standard RDD is used to draw random numbers covering all frequency series allocated to all operators across all telecom circles in India. CVoter ensures proper representative analysis by statistical weighing of the data to make it representative of the local population as per the latest Census figures. The data is weighted to a known Census profile, including gender, age, education, income, religion, caste, urban/rural and vote recalls for the last Lok Sabha and Vidhan Sabha elections. For the analytics, CVoter uses its proprietary algorithm to calculate the provincial and regional vote share based on the split-voter phenomenon.
