Chapter 2: The Great Indian Migration Wave

1. Regions are identified based on three indicators—outmigrant to population ratio, sex selectivity of outmigration and remittance receiving propensity—calculated from the 64th National Sample Survey of 2007–08. For historic data, inference is made using age-adjusted sex ratios. About the link between migration and sex ratios in India, see Chinmay Tumbe, ‘The Missing Men: Migration and Sex Ratios’, *India Migration Report 2015: Migration and Gender,* ed. S. Irudaya Rajan (Routledge, 2015), pp. 221–39. The benchmark of 5 per cent for ‘mass migration’ is close to that used by Timothy Hatton and Jeffrey Williamson, *The Age of Mass Migration* (Oxford University Press, 1998), p. 9.
