WHAT IS PREDICTIVE HEALTHCARE?

- Predictive analytics in healthcare uses Artificial Intelligence (AI), gene markers and diagnostic tools to make predictions on the risk or likelihood of future disease
- Recommended for those above the age of 40, with a family history of diseases or an unhealthy lifestyle

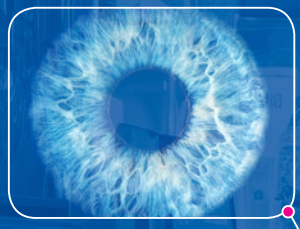

HOW DOES IT WORK?

- **Pre-screening:** A patient is assessed on family history/ lifestyle
- **Screening:** Blood tests and various body scans ascertain his clinical condition. Some companies may use AI machines even at this stage, to detect abnormalities
- **Genetic testing:** Blood tested for genetic markers associated with a disease
- **AI prediction:** Machines use algorithms to compare test results, other factors with its data set to predict disease risk
- **Intervention:** Doctors suggest lifestyle changes/ medicines to delay or reverse the disease

THE DISEASES THAT CAN BE PREDICTED

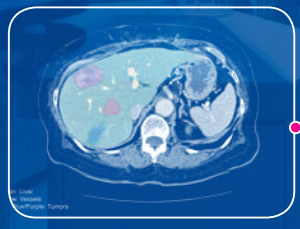

EYE DISEASE

Predicted using retina scans, blood markers and genetic tests

LIVER DISEASE

Predicted using genetics, blood reports and CT scans

RECCURENT PREGNANCY LOSS

Predicted using genetic tests

AUTOIMMUNE DISEASE

Predicted through genetic tests

ALZHEIMER'S

Predicted using MRI scans and genetic tests

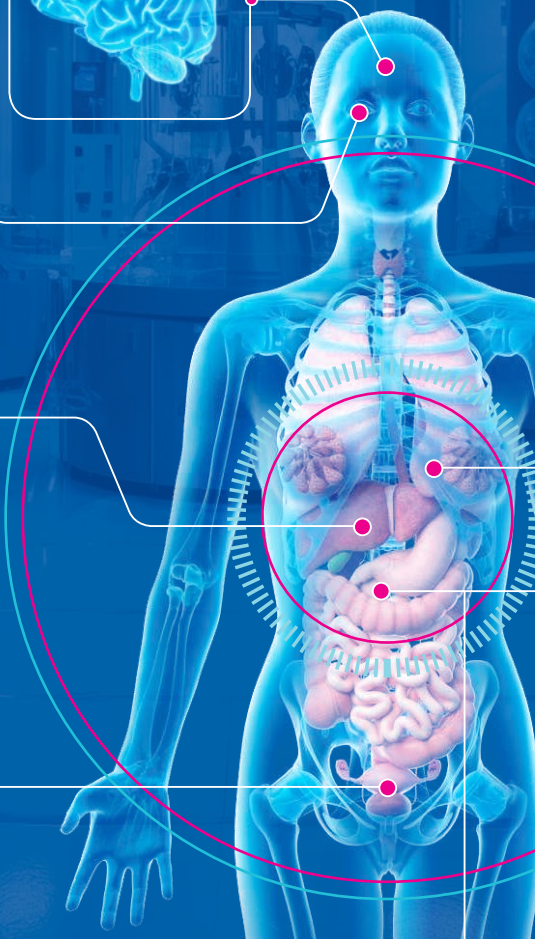

DEPRESSION

Predicted using blood reports, genetic tests

STROKE

Predicted using neuroimaging, information on lifestyle diseases like hypertension/ diabetes besides other factors like smoking/alcohol consumption

COMMON CANCERS

Predicted using blood markers, genes and high-imaging radiation machines that can detect small growths

TYPE 2 DIABETES

Predicted using lifestyle parameters, family history, body fat percentage, baseline glucose and HbA1c test
