The vertical rising of moist air forms clouds and bring precipitation.

In the lower atmosphere the pressure decreases rapidly with height.

At the height of Mt. Everest, the air pressure is about two-thirds less than what it is at the sea level.

7. *Coriolis Force:* Once air has been set in motion by the pressure gradient force, it undergoes an apparent deflection from its path, as seen by an observer on the earth. This apparent deflection is called the “Coriolis force” and is a result of the earth’s rotation.

8. Walker Cell: Warming and cooling of the Pacific Ocean is most important in terms of general atmospheric circulation.

   The El Nino event is closely associated with the pressure changes in the Central Pacific and Australia. This change in pressure condition over Pacific is known as the southern oscillation.

   The combined phenomenon of southern oscillation and El Nino is known as ENSO.
