

9.

Cold wind	*Warm winds*
• Pampero • Gregale • Bora • Tramontane • Mistral	• Foehn or Fohn • Chinook • Zonda • Loo • Sirocco

10. The homogenous surfaces, over which air masses form, are called the source regions. The main source regions are the high pressure belts in the sub tropics (giving rise to tropical air masses) and around the poles (the source for polar air masses).
11. Winds do not flow from tropical high pressure (in upper troposphere) to polar low (in upper troposphere) directly.
    Because these winds are geostrophic, i.e., they flow at great speeds due to low friction and are subjected to greater Coriolis force.
    So they deflect greatly giving rise to three distinct cells called Hadley cell, Ferrel Cell and Polar cell. Instead of one big cell we have three small cells that combinedly produces the same effect.
12. There are two permanent jet streams - subtropical jets at lower latitudes and polar front jets at midlatitudes.
    Temporary jet streams are few. Important ones are Somali jet and the African Easterly jet.
13. **Dew point**: The air containing moisture to its full capacity at a given temperature is said to be saturated. It means that the air at the given temperature is incapable of holding any additional
