Western Pacific].

Only SO = [Low Pressure over Eastern Pacific + High Pressure over Western Pacific]

24. Similar to ENSO, the atmospheric component of the IOD was later discovered and named as **Equatorial Indian Ocean Oscillation [EQUINOO]**, Oscillation of warm water and atmospheric pressure between Bay of Bengal and Arabian Sea.
25. **Effects of La Nina**
    - Some of the other weather effects of La Niña include
    1. abnormally heavy monsoons in India and Southeast Asia,
    2. cool and wet winter weather in southeastern Africa, wet weather in eastern Australia,
    3. cold winter in western Canada and northwestern United States,
    4. winter drought in the southern United States.
26. *Epiphyte:* An epiphyte is a plant that grows harmlessly upon another plant (such as a tree) and derives its moisture and nutrients from the air, rain, and sometimes from debris accumulating around it.

    All plants struggle upwards (most ephiphytes) for sunlight resulting in a peculiar layer arrangement.
27.
    - Broad-leaved hardwood trees. Well developed in southeast Asia. Trees are normally deciduous, because of the marked dry period, during which they shed their leaves to withstand the drought [They shed their leaves to prevent loss water through transpiration].
    - The forests are more open and less luxuriant than the equatorial jungle and there are far fewer species.
    - The basic cause of monsoon climates is the difference in the rate of heating and cooling of land and sea (This is old theory. New theory will be explained while studying Indian Climate).

    In the summer, when the sun is overhead at the Tropic of Cancer, a low pressure is created in Central Asia.
28. **Statement 1: INCORRECT**—The aridity of the hot deserts is mainly due to the effects of off-shore Trade Winds, hence they are also called Trade Wind Deserts.

    The major hot deserts of the world are located on the western
