coasts of continents between latitudes 15° and 30°N. and S.

Statement 2: INCORRECT—The temperate deserts are rainless because of either continentiality or rain-shadow effect. Gobi desert is formed due to con- tinentality and Patagonian desert due to rain-shadow effect.

29. **Statement 1: CORRECT**—Characterised by a warm moist summer and a cool, dry winter (one exception: winters are also moist in Natal Type).

Statement 2: CORRECT—Rainfall is more than moderate, anything from 60 cm to 150 cm.

- This is adequate for all agricultural purposes and hence supports a wide range of crops.
- Areas which experience this climate are very densely populated.

Difficulty Level: Medium

30. British Type Climate
    - Moderately warm summers and fairly mild winters.
    - Rainfall occurs throughout the year with winter maxima.

    The climate is experienced in southern Chile, Southern Australia, Tasmania and most parts of New Zealand.
31. The International Date Line (IDL) passes through the Pacific Ocean. It is an imaginary line, like longitudes and latitudes.

    The time difference on either side of this line is 24 hours. So, the date changes as soon as one crosses this line.

    Some groups of Islands (Polynesia, Melanesia, Micronesia) fall on either of the dateline. So if the dateline was straight, then two regions of the same Island country or Island group would fall under different date zones. Thus to avoid any confusion of date, this line is drawn through where the sea lies and not land. Hence, the IDL is drawn in a zig-zag manner.
32. **Statement 1: INCORRECT—Solstice**

    On 21st June, the northern hemisphere is tilted towards the sun. The rays of the sun fall directly on the Tropic of Cancer. As a result, these areas receive more heat.

    At this time in the southern hemisphere all these conditions are reversed. It is winter season there. The nights are longer than the
