crossing the mountain ranges condense and precipitate. When it descends down the leeward side of the slope the dry air gets warmed up by adiabatic process. This dry air may melt the snow in a short time.

76. **Statement 1: INCORRECT**—Foehn is a hot wind of local importance in the Alps. It is a strong, gusty, dry and warm wind which develops on the leeward side of a mountain range. As the windward side takes away whatever moisture there is in the incoming wind in the form of orographic precipitation, the air that descends on the leeward side is dry and warm (Katabatic Wind).
The wind helps animal grazing by melting snow and aids the ripening of grapes. It is a beneficial wind.
Statement 2: CORRECT—Mistral: It is a Harmful Wind. It is channeled through the Rhine valley. It is very cold and dry with a high speed. It brings blizzards into southern France.
Statement 3: CORRECT—Sirocco: It is a Harmful Wind. Sirocco is a Mediterranean wind that comes from the Sahara and reaches hurricane speeds in North Africa and Southern Europe.
The Sirocco causes dusty dry conditions along the northern coast of Africa, storms in the Mediterranean Sea, and cool wet weather in Europe.

77. **Statement 1: CORRECT**—Inversions play an important role in determining cloud forms, precipitation, and visibility.
Statement 2: CORRECT—An inversion acts as a cap on the upward movement of air from the layers below. As a result, convection produced by the heating of air from below is limited to levels below the inversion. Diffusion of dust, smoke, and other air pollutants is likewise limited.
Statement 3: INCORRECT—Inversions also affect diurnal variations in temperature. Diurnal variations tend to be very small.

78. **Rossby Waves:**
    - The meandering jet streams are called Rossby Waves.
    - Rossby waves are natural phenomenon in the atmosphere and oceans due to rotation of earth.
    - In planetary atmospheres, they are due to the variation in the Coriolis effect (When temperature contrast is low, speed of jet
