mass completely sits over the cold air mass.

Statement 3: CORRECT—At actual front, dark nimbus and cumulonimbus clouds cause heavy showers. A cold front passes off rapidly, but the weather along it is violent.

33. **Statement 1: CORRECT**—Relation between Absolute Humidity and Relative Humidity is depend upon the temperature. With the change of air temperature, the capacity to retain moisture increases or decreases and the relative humidity is also affected.

Statement 2: INCORRECT—Relative humidity is greater over the oceans and least over the continents. Absolute humidity is greater over oceans because of greater availability of water for evaporation.

34. **Factors Affecting Rate of Evaporation:**
    - Amount of water available
    - Temperature
    - Relative humidity
    - Area of evaporating surface
    - Wind speed: A high wind speed removes the saturated air from the evaporating surface and replaces it with dry air which favours more evaporation.
    - Whenever there is a combination of high temperature, very low relative humidity and strong winds, the rate of evaporation is exceptionally high. This leads to dehydration of soil to a depth of several inches.
    - Air Pressure: Evaporation is also affected by the atmospheric pressure exerted on the evaporating surface. Lower pressure over open surface of the liquid results in a higher rate of evaporation.
    - Composition of water: Evaporation is inversely proportional to salinity of water. Rate of evaporation is always greater over fresh water than over salt water.

35. **Statement 1: INCORRECT**—The difference between the mist and fog is that mist contains more moisture than fog.

Statement 2: INCORRECT—In mist, visibility is more than one kilometer but less than two kilometres. In fog, visibility is less than one kilometer.

Statement 3: INCORRECT—Mist is also formed by water
