droplets, but with less merging or coalescing. This means mist is less dense and quicker to dissipate.

Mists are frequent over mountains as the rising warm air up the slopes meets a cold surface.

Fogs are drier than mist and they are prevalent where warm currents of air come in contact with cold currents.

36. **Statement 1: INCORRECT**—Haze is traditionally an atmospheric phenomenon where dust, smoke and other dry particles obscure the clarity of the sky (No condensation. Smog is similar to haze but there is condensation in smog).

Statement 2: CORRECT—Photochemical forms when pollutants such as nitrogen oxides (primary pollutant) and organic compounds (primary pollutants) react together in the presence of SUNLIGHT. A gas called OZONE (Secondary pollutant) is formed.

Statement 3: CORRECT—The atmospheric pollution levels of Los Angeles, Beijing, Delhi, Mexico City and other cities are increased by inversion that traps pollution close to the ground.

37. Rainfall: drop size more than 0.5 mm.

Virage: raindrops evaporate before reaching the earth.

Drizzle: light rainfall; drop size less than 0.5 mm. Mist: evaporation occurs before reaching the ground leading to foggy weather.

Snowfall: fine flakes of snow fall when the temperature is less than 0°C.

Sleet: frozen raindrops and refrozen melted snow; mixture of snow and rain or merely partially melted snow.

Hail: precipitation in the form of hard rounded pellets is known as hail; 5 mm and 50 mm.

38. **Statement 1: INCORRECT**—Between the latitudes 35° and 40° N and S of the equator, the rain is heavier on the eastern coasts and goes on decreasing towards the west. But, between 45° and 65° N and S of equator, due to the westerlies, the rainfall is first received on the western margins of the continents and it goes on decreasing towards the east.

Statement 2: CORRECT—Winter monsoons do not cause rainfall as they move from land to the sea. It is because firstly, they have little humidity; and secondly, due to anti cyclonic circulation on
