It splits into two branches, one flowing to the east of Madagascar known as Agulhas current and the other between Mozambique and Western Madagascar coast known as Mozambique current.

At the southern tip of Madagascar, these two branches mix and are commonly called as the Agulhas current. It still continues to be a warm current, till it merges with the West Wind Drift.

21. Factors Affecting Temperature Distribution of Oceans
    - Insolation
    - Heat loss
    - Albedo
    - Physical characteristics of the sea surface: Boiling point of the sea water is increased in the case of higher salinity and vice versa

    Salinity increased = Boiling point increased = Evaporation decreased.
    - The presence of submarine ridges and sills [Marginal Seas]: Temperature is affected due to lesser mixing of waters on the opposite sides of the ridges or sills.
    - Shape of the ocean
    - Enclosed seas (Marginal Seas - Gulf, Bay, etc.) in the low latitudes record relatively higher temperature than the open seas.
    - Local weather conditions such as cyclones.
    - Unequal distribution of land and water
    - Prevalent winds
    - Ocean currents
22. Statement 1: CORRECT—The rate of decrease of temperature with depths is greater at the equator than at the poles.

    Statement 2: CORRECT—The enclosed seas of low latitudes like the Sargasso Sea, the Red Sea and the Mediterranean Sea have high bottom temperatures due to high insolation throughout the year and lesser mixing of the warm and cold' waters.
23. Statement 1: CORRECT—Together, the gravitational pull and the centrifugal force are responsible for creating the two major tidal bulges on the earth. On the side of the earth facing the moon, a tidal bulge occurs while on the opposite side though the gravitational attraction of the moon is less as it is farther away, the
