Statement 3: INCORRECT—Seamounts can be found along Abyssal plains.

32. Statement 1: INCORRECT—Isthmus is the land- equivalent of a strait, i.e., a narrow strip of land connecting two larger land masses.

Example: Isthmus of Panama and Isthmus of Suez.

Statement 2: INCORRECT—Gulfs: A gulf is a large body of water, sometimes with a narrow mouth, that is almost completely surrounded by land.

Statement 3: INCORRECT—A bay is a small body of water that is set off from a larger body of water generally where the land curves inward.

In simple words, bay is a water body surrounded on three sides by land with the fourth side (mouth) wide open towards oceans.

33. Statement 1: CORRECT—Denser water tends to sink, while relatively lighter water tends to rise. Cold-water ocean currents occur when the cold water at the poles sinks and slowly moves towards the equator.

Warm-water currents travel out from the equator along the surface, flowing towards the poles to replace the sinking cold water.

Statement 2: CORRECT—The ocean currents may be classified based on their depth as surface currents and deep water currents:

1. surface currents constitute about 10% of all the water in the ocean, these waters are the upper 400 m of the ocean;
2. deep water currents make up the other 90% of the ocean water. These waters move around the ocean basins due to variations in the density and gravity.

Deep waters sink into the deep ocean basins at high latitudes, where the temperatures are cold enough to cause the density to increase.

Statement 3: INCORRECT—The general movement of the currents in the northern hemisphere is clockwise and in the southern hemisphere, anticlockwise. This is due to the Coriolis force which is a deflective force and follows Ferrel's law.

34. Ocean currents are classified based on temperature: as cold currents and warm currents:
