91. (b)	**92.** (c)	**93.** (b)	**94.** (c)	**95.** (c)
96. (a)	**97.** (d)	**98.** (b)	**99.** (c)	**100.** (b)

Explanations

Difficulty Level: Easy

1.
   - The region on earth that supports life: Biosphere
   - Area where an organism lives: Habitat
   - A functional unit of the environment: Ecosystem
   - The flora and fauna of a geographical area: Biodiversity
2. Frost results in freezing the soil moisture. The plants are killed due to increased transpiration when their roots are unable to supply moisture. Extremely high intensity favours root growth than shoot growth which results in increased transpiration, short stem, smaller thicker leaves. On the other hand, low intensity of light retards growth, flowering and fruiting.
3.
   - An adaptation is, “the appearance or behaviour or structure or mode of life of an organism that allows it to survive in a particular environment”.
   - Variations are induced by changes in genetic makeup due to addition or deletion of certain genes.
   - Adaptive radiation is a process in which organisms diversify from an ancestral species into a multitude of new forms when the environment creates new challenges or opens new environmental niches.
   - Speciation is the process by which new species are formed, and evolution is the mechanism by which speciation is brought about.
