4. Organisation

5. Difference between Habitat and Environment
   - A habitat always has life in it, whereas the environment does not necessarily have life in it.
   - All habitats are environments, but all environments are not habitats.
   - A habitat is always a preference of one species.
   - An environment could be a preference of many species that could eventually become many habitats.
   - Usually, the environment governs the properties of a habitat, but not vice versa.
6. In ecology, the term homeostasis applies to the tendency for a biological system to resist changes. Ecosystems are capable of maintaining their state of equilibrium. They can regulate their own species structure and functional processes. This capacity of the ecosystem of self-regulation is known as homeostasis. For example, in a pond ecosystem, if the population of zooplankton increases, they consume a large number of the phytoplankton and as a result, food would become scarce for zooplankton. However, the homeostatic capacity of ecosystems is not unlimited as well as not everything in an ecosystem is always well regulated.
7. The trophic level interaction involves three concepts namely
   1. Food Chain
   2. Food Web
   3. Ecological Pyramids
