- Though forests form the climax community in most of the ecosystems, in the grassland ecosystem grasses form the climax community. Thanks to fire and lack of water.
- Grasslands are almost irreversible once deforestation in water-scarce areas gives way to grasslands.

11. Andamans, Lakshadweep declared 'hope spots' by IUCN

Two groups of islands are the first in India to make it to the list of 50 global hope spots with significant wildlife and underwater habitats.

12. Heat loss or heat gain is a function of surface area. Since small animals have a larger surface area relative to their volume, they tend to lose body heat very fast when it is cold outside; then they have to expend much energy to generate body heat [a lot of food goes into heat generation] through metabolism. This is the main reason why very small animals are rarely found in polar regions.

13.

- In an aquatic ecosystem, the grazing food chain is the major conduit for energy flow.
- As against this, in a terrestrial ecosystem, a much larger fraction of energy flows through the detritus food chain than through the grazing food chain.
