- National parks are areas reserved for wildlife where they can freely use the habitats and natural resources.
- The difference between a Sanctuary and a National Park mainly lies in the vesting of rights of people living inside. Unlike a Sanctuary, where certain rights can be allowed, in a National Park, no rights are allowed. No grazing of any livestock shall also be permitted inside a National Park while in a Sanctuary, the Chief Wildlife Warden may regulate, control or prohibit it.
- The purpose of the ESZ was to provide more protection to the parks by acting as a shock absorber or transition zone. Eco-Sensitive Zones would minimise forest depletion and man-animal conflict.

60.

- The Economics of Ecosystems and Biodiversity (TEEB) is an international initiative to draw attention to the global economic benefits of biodiversity.
- In 2007, environment ministers from the G8+5 countries meeting in Germany proposed TEEB to initiate the process of

1. analysing the global economic benefit of biological diversity,
2. the costs of the loss of biodiversity and
3. the failure to take protective measures versus the costs of effective conservation.

Difficulty Level: Tough

61.

- More blue light will lead to shorter stems and thicker leaves.
- Too much far-red light or an unequal balance with the red light will result in elongated plants.
- A low red to far-red ratio and consequently a limited amount of red light at the beginning of the night is important for the flowering of short-day plants.
- Far red light alone does not regulate flowering
- Green light is beneficial for the photosynthesis, although it does not affect the flowering or plant development.

62. The term diversity is itself indicating that the marine fish now has different species in different habitats and ecosystems. Which
