- 2014: COP 20/CMP 10, Lima, Peru
  The tenth session of the Meeting of the Parties (CMP) to the 1997 Kyoto Protocol (the protocol having been developed under the UNFCCC's charter). The pre-COP conference was held in Venezuela.
- 2015: COP 21/CMP 11, Paris, France Negotiations resulted in the adoption of the Paris Agreement on 12 December, governing climate change reduction measures from 2020. The adoption of this agreement ended the work of the Durban platform, established during C0P17. The agreement will enter into force (and thus become fully effective) on 4 November 2016. On 4 October 2016, the threshold for adoption was reached with over 55 countries representing at least 55% of the world's greenhouse gas emissions ratifying the Agreement.
- 2018: COP 24/CMP 14/CMA 1-3, Katowice, Poland
  The Polish government's vision for presidency states that the organisation of COP 24 will provide an opportunity for convincing other countries that Poland does not hamper the process of tackling dangerous climate change and that Poland is one of the leaders of this process.

32. • The Kyoto Protocol applies to the six green-house gases listed in Annex A: Carbon dioxide (CO_2), Methane (CH_4), Nitrous oxide (N_2O), Hydrofluorocarbons (HFCs), Perfluorocarbons (PFCs), and Sulphur hexafluoride (SF_6).
- The Protocol is based on the principle of common but differentiated responsibilities.
- If the enforcement branch determines that an Annex I country is not in compliance with its emissions limitation, then that country is required to make up the difference during the second commitment period plus an additional 30%.
  In addition, that country will be suspended from making transfers under an emissions trading program.
- 192 parties have ratified the protocol (191 states and one regional economic integration organisation). The United States has not; it dropped out in 2001. The protocol mandated that 37 industrialised nations plus the European Community cut their greenhouse gas emissions.
