third place respectively. India stands at fourth position in Rubber production.

Difficulty Level: Medium

26. Statement 1: INCORRECT—The tundra climate, associated with the cold, treeless plains of the Arctic lowlands of Asia.
    Statement 2: INCORRECT—The mountain-steppe highland subtropical climate of West and Central Asia.
27. The subtropical monsoon climate is associated with the southern Japan and of south-eastern China.The subequatorial monsoon climate is associated with the South Asia, eastern Java, and the Lesser Sunda Islands, and the equatorial climate is associated with the Greater Sunda Islands.
28. South of the Siberian forests are found forest-steppes, with forest galleries lining the rivers. Forest-steppe and meadow-steppe vegetation is predominant on the Northeast (Manchurian) Plain. The steppe (grassland) zone runs from Kazakhstan in the west through the Altai Mountains to the Da Hinggan Range in the east. Herbaceous cover of feather grass, rootstock grasses, and sagebrush is utilised for grazing. Farther south discontinuous semi-desert and desert vegetation predominates. To the east the steppes stretch toward the southern part of the Ordos Plateau, forming the transition to the monsoonal landscapes of eastern China.
29. A variety of conifers of both hemispheres also occurred along Yangtze river, and in the mountains of eastern Sichuan there grew a rare and ancient Chinese conifer, the dawn redwood. Palm trees are found throughout South China and southern South Korea, as well as in the southern parts of Japan; many varieties of bamboo also are found in those regions.
30. Mangrove swamps thrive in the sheltered muddy coasts and deltas. Their outermost edges are represented by species of *Rhizophora* (red mangrove), followed by those of *Bruguiera* and *Avicennia* (white mangrove). The bogs on the landward edges of those swamps abound with the semiaquatic nipa palm.
