Explanation (50)

54. The Colorado Plateau is a massive feature with a series of relatively flat-bedded tablelands, made steplike by faulting action and intruded by domes of igneous rocks. Its slow rate of uplift was matched by the steady downcutting of the Colorado River and its tributaries, producing the Grand Canyon-one of the most spectacular gorges in the world. Westward rise the mountains of the Sierra Nevada, which reach to nearly 15,000 feet (4500 metres), are intensively folded and faulted, and continue north in the Cascade Range, which is marked by some of North America's most beautiful volcanic cones.

55.
