hickory, elm, ash, and birch-but also has a good deal of coniferous softwood, including pine and the eastern hemlock. White pine and white and red oak once were abundant but have largely been cut for timber. American elm, which formerly was dominant in the moister soils, has been greatly reduced nearly everywhere by Dutch elm disease. The long, hot, humid days of summer, when tropical gulf air predominates, lead to huge-crowned, large-leaved trees, which shed their cover with the return of winter and continental polar air masses.

60. **The Cordilleran forest:** Species include elk and deer in the fir-spruce forests, antelope in the open parkland, and goats high up in the alpine pastures. Preying on these are the mountain lion and the occasional pack of wolves.

    The boreal forest: Whitefish are caught in great numbers in Great Slave Lake, but because of pollution they are much less prevalent in the Great Lakes than they once were.

    The Laurentian mixed forest: Squirrels and chipmunks are still common, but wild mink and marten have become rare.

61. **Major Rivers**: River Frazer, River Mackenzie, River Churchill, River St. Lawrence, River Mississippi, River Missouri, River Red, River Rio Grande, River Colorado, River Columbia, River Yukon, River Ohio and River Arkansas.

62. Statement 1: INCORRECT—The world famous Niagara Falls is located between Lake Erie and Lake Ontario.
