Important Tributaries are : Left: Marañón, Napo, Japurá/Caquetá, Rio Negro/Guainía, Putumayo, Trombetas Right: Ucayali, Javary, Juruá, Purús, Madeira, Tapajós, Xingu

60.

1. The Sao Francisco is a river in Brazil.
2. The Ucayali River is the main headstream of the Amazon River. It rises about 110 km (68 mi) north of Lake Titicaca, in the Arequipa region of Peru.
3. The Madeira River traces along for 2100 miles through Brazil and Bolivia, and is one of the most important tributaries of the Amazon.
4. The Paraná River is a river in south Central South America, running through Brazil, Paraguay and Argentina.

61. Galapagos Island- North-West Easter Island- West Falkland Island- South-East Shetland Island- South-East

62. Fertile soils extend over only about ten percent of the surface of South America. The most important of these are brunizems (deep, dark-coloured prairie soils, developed from wind-deposited loess), chestnut soils, and ferruginous tropical soils. On the low coastal ranges, in the foothills of the western Andes, and on the nearby plains and terraces of Colombia and Ecuador, the soils consist mainly of red-yellow latosols, podzols, and alluvial soils. Soils in southern Brazil and Uruguay consist of brunizems, reddish prairie soils, and planosols. The Argentine Pampas, the largest fertile area on the continent, is uniformly covered with the so-called pampean loess, which is calcareous, rich in minerals, and mixed with volcanic sediment.Less rich soils are found in the uplands of northeastern and central Brazil, consisting mainly of sandy regosols in the north and red latosols in the south.

63. About ten percent of the total area are poorly drained, the soils being either gleys (clayey soils in which the substrate is bluish gray, generally sticky, and often structureless because of excessive moisture), groundwater laterites, grumosols (soils with a high content of expanding clays), or planosols (a type of soil found in humid climates in which soluble salts and minerals are leached out of the upper layers and are cemented or compacted at a lower level).
