notable tsunamis. A marine volcanic eruption can generate an impulsive force that displaces the water column and gives birth to a tsunami. During a submarine landslide, the equilibrium sea-level is altered by sediment moving along the floor of the sea. Gravitational forces then propagate a tsunami. Landslides along the coast, high intensity explosions can also cause tsunami.

13. The correct combination is:
    - Igneous Rocks—solidified from magma and lava.
    - Sedimentary Rocks—the result of deposition of fragments of rocks.
    - Metamorphic Rocks—formed out of existing rocks undergoing recrystallisation.
14. The correct combination is:

    Igneous Rocks—Granite, Basalt; Coal is organically formed sedimentary rock which can be transformed into Anthracite on applying heat.

    Sedimentary Rocks—
    - Mechanically formed—sandstone, conglomerate, limestone, shale, loes, etc.
    - Organically formed—geyserite, chalk, limestone, coal, etc.
    - Chemically formed—chert, limestone, halite, potash, etc.

    Metamorphic Rocks—Marble

    Some Examples of Metamorphism

$$\text{Granite} \xrightarrow{\text{Pressure}} \text{Gneiss}$$

$$\text{Clay, Shale} \xrightarrow{\text{Pressure}} \text{Schist}$$

$$\text{Sandstone} \xrightarrow{\text{Heat}} \text{Quartzite}$$

$$\text{Clay, Shale} \xrightarrow{\text{Heat}} \text{Slate} \xrightarrow{\text{Heat}} \text{Phyllite}$$

$$\text{Coal} \xrightarrow{\text{Heat}} \text{Anthracite, Graphite}$$

$$\text{Limestone} \xrightarrow{\text{Heat}} \text{Marble}$$

15. The extended depression on ground through which a stream flows throughout its course is called a river valley. A deep and narrow ‘V’ shaped valley is also referred to as gorge and may result due to downcut- ting erosion and because of recession of a waterfall. An extended form of gorge is called a Canyon.
16. Glacial Erosional Landforms
