13. *Grazing food-chain* and *detritusfood-chain.* In a grazing food-chain, the first level starts with plants as producers and ends with carnivores as consumers at the last level, with the herbivores being at the intermediate level.

    A biome is a plant and animal community that covers a large geographical area. It is the total assemblage of plant and animal species interacting within specific conditions These include rainfall, temperature, humidity and soil conditions.

    The *primary consumers* include herbivorous animals only.

    The study of interactions between life forms (biotic) and the physical environment (abiotic) is the science of ecology.

14. The location where sinking of a plate occurs is called a *subduction zone.*

    Plates move horizontally over the asthenosphere as rigid units. The lithosphere includes the crust and top mantle with its thickness range varying between 5 and 100 km in oceanic parts and about 200 km in the continental areas.

15. Mass movements transfer the mass of rock debris down the slopes under the direct influence of gravity.

    Several activating causes precede mass movements. They are: (i) removal of support from below to materials above through natural or artificial means; (ii) increase in gradient and height of slopes; (iii) overloading through addition of materials naturally or by artificial filling; (iv) overloading due to heavy rainfall, saturation and lubrication of slope materials; (v) removal of material or load from over the original slope surfaces; (vi) occurrence of earthquakes, explosions or machinery; (vii) excessive natural seepage; (viii) heavy drawdown of water from lakes, reservoirs and rivers leading to slow outflow of water from under the slopes or river banks; (ix) indiscriminate removal of natural vegetation.

16. The Brahmaputra, one of the largest rivers of the world, has its origin in the Chemayungdung glacier of the Kailash range near the Mansarovar lake. From here, it traverses eastward longitudinally for a distance of nearly 1,200 km in a dry and flat region of southern Tibet, where it is known as the Tsangpo, which means ‘the purifier.’ The Rango Tsangpo is the major right bank tributary of this river in Tibet.
