    Sill is a volcanic landform in form of tabular sheet intrusion caused by volcanic lava.

22. Sea cliff is the only marine erosion landform among options. Sea cliff is a Shoreline marked by a steep bank.

    Bar: Rock debris and sand deposited along the coast at a distance from shoreline by tidal currents.

    Barrier is an overwater counterpart of a bar.

    Tombolo is a bar connecting the islands formed by tidal currents and waves.

23. Karst is a landscape which is underlain by limestone which has been eroded by dissolution, producing towers, fissures, sinkholes, etc. The water containing limestone in solution, seeps through the roof in the form of a continuous chain of drops. The water containing limestone in solution, seeps through the roof in the form of a continuous chain of drops. A portion of the roof hangs on the roof and on evaporation of water, a small deposit of limestone is left behind contributing to the formation of a stalactite, growing downwards from the roof. The remaining portion of the drop falls to the floor. This also evaporates, leaving behind a small deposit of limestone aiding the formation of a stalagmite, thicker and flatter, rising upwards from the floor. Sometimes, stalactite and stalagmite join together to form a complete pillar known as the column.
