Therefore, states like Assam, Himachal Pradesh, and other hilly terrains have a lower density of population. While the northern plains and coastal areas like Kerala, West Bengal and Maharashtra have very high population density.

12. This is largely influenced by three main factors like birth, death and migration of people in a given year.
    - Birth rate: The number of children born per 1000 people in a year
    - Death rate: The number of people died per 1000 people in a year.

    What is most noteworthy here is that the birth rate in India is and has always been higher than the death rate, which is a major reason behind population growth.

    The third and one of the most important factors of population change is migration. Migration can be internal (between states) and international (between countries). While internal migration does not lead to population change, it does affect the population density in the migrated areas.
13. One of the most important characteristics of the population of India, the age composition determines the country's social and economic structure. The total population is broadly divided into three age groups-
    - Children- below 15 years
    - Working age- 15- 59 years
    - Aged (Senior)- 59 years and above
14. Population density is a measurement of population per unit volume or unit area. It is a key geographical term. So the density of population is the number of people living in a particular space, say one kilometer or one mile. It is determined by dividing the population of an area by its land area.
15. The sex ratio of population is determined by the number of females for every 1000 males. This helps in understanding the equality of males and females in the society, which consequently gives an idea of the nation's culture. India's sex ratio has always been on the lower side, until recently. States like Kerala and Union Territory of Pondicherry have higher sex ratio than the major states.
