rate. The population increase in the world is mainly due to rapid increase in natural growth rate.

33. Statement I: CORRECT—Rates of population growth vary across the world. Although, the world's total population is rising rapidly, not all countries are experiencing this growth. Some countries like Kenya have high population growth rates. They had both high birth rates and death rates.
Statement II: INCORRECT—Now, with improving health care, death rates have fallen, but birth rates still remain high leading to high growth rates. In other countries like United Kingdom, population growth is slowing because of both low death and low birth rates.

34. Statement I: CORRECT—To understand the role of people as a resource, we need to know more about their qualities. People vary greatly in their age, sex, literacy level, health condition, occupation and income level. It is essential to understand these characteristics of the people. Population composition refers to the structure of the population.
Statement II: CORRECT—The composition of population helps us to know how many are males or females, which age group they belong to, how educated they are and what type of occupations they are employed in, what their income levels and health conditions are.

35. Statement I: INCORRECT—The population density of India in the year 2011 was 382 persons per sq km.
Statement II: INCORRECT—Densities vary from 1102 persons per sq km in Bihar to only 17 persons per sq km in Arunachal Pradesh. A study of the shows the pattern of uneven distribution of population densities at the State level.
Note that the States with population densities below 250 persons per square km. rugged terrain and unfavourable climatic conditions are primarily responsible for sparse population in these areas.

36. Statement I: CORRECT—Population is a dynamic phenomenon. The numbers, distribution and composition of the population are constantly changing. This is the influence of the interaction of the three processes, namely — births, deaths and migrations.
