# Explanations

## Difficulty Level: Easy

1. Subsistence agriculture is one in which the farming areas consume all, or nearly so, of the products locally grown. It can be grouped in two categories — Primitive Subsistence Agriculture and Intensive Subsistence Agriculture. Primitive subsistence agriculture or shifting cultivation is widely practised by many tribes in the tropics, especially in Africa, south and Central America and south East Asia the vegetation is usually cleared by fire, and the ashes add to the fertility of the soil. Shifting cultivation is thus, also called slash and burn agriculture. The cultivated patches are very small and cultivation is done with very primitive tools such as sticks and hoes.
2. The basic resources for agriculture are sunlight, soil and water, besides the seeds and animal breeds, and human endeavour. Another important input is the agro technique. Agricultural production is adversely affected if any of these factors is limited, or disturbed.

   Obviously, scientific study enables technological innovations to manipulate these factors to maximise production. Increasingly nowadays, application of science and technology also involves
