environmentalists and food management personnel in 1565 villages.

9. Biopesticides are certain types of pesticides derived from such natural materials as animals, plants, bacteria, and certain minerals. For example, canola oil and baking soda have pesticidal applications and are considered biopesticides. Biopesticides, namely, fall into three major classes:
   (i) Microbial pesticides consist of a microorganism (e.g., a bacterium, fungus, virus or protozoan) as the active ingredient. Microbial pesticides can control many different kinds of pests, although each separate active ingredient is relatively specific for its target pest[s]. For example, there are fungi that control certain weeds, and other fungi that kill specific- insects.
10. The world's first hybrid pigeonpea plant—ICPH 8—was bred and released by scientists at the International Crops Research Institute for the SemiArid Tropics (ICRISAT) near Hyderabad, in 1991. ICPH 8 takes a short duration to mature, escapes diseases, such as fusarium wilt and sterility mosaic, and yields 30 to 40% more than the popular open- pollinated varieties. It performs well under drought as well as high-moisture conditions.

    A change in the developmental rhythm has made it possible to grow mung and urad in winter and summer and rajmah in the plains. In chickpea or chana it is possible to grow plants which are erect with many branches and pods from base to tip. Examples of new cultivars: BG 244, ICC 34 (gram): LB G17, ADT3 (urad), MLZ 67, C04 (mung), Rachna (fieldpea).
11. Jute is a traditional crop, but its demand has been adversely affected by development of other materials for packaging, changes in storage and transportation. However, an environmentally conscious world is now showing renewed interest in jute. The Central Research Institute for Jute and Allied Fibres (CRIJAF), ICAR, played a pivotal role in developing improved production technology for both jute and Mesta.

    High yielding varieties apart, the CRIJAF has also developed a package of practices recommending fertiliser schedules for different situations, foliar fertilisation, row cropping with multi-row
