crore has been allocated for the scheme, an 18% increase over the revised estimates of 2018-19.

39. Statement I: INCORRECT—Between 2001-02 and 2017- 18, production of horticulture crops increased from 146 million tonnes to 312 million tonnes. This implies that the horticulture production increased at an average rate of 4.9%. Production of foodgrains increased at a rate of 1.7% during the same period. In 2017-18, fruits and vegetables contributed to 31% and 59% of the total horticultural production.

The National Mission on Horticulture seeks to promote horticulture by providing availability of quality inputs such as planting material, and post-harvest interventions such as reduction in losses and access to markets. In 2019-20, the scheme has been allocated ' 2225 crore, which is six per cent more than the revised estimate of 2018-19.

Statement II: INCORRECT—Agriculture marketing in most states is regulated by the Agriculture Produce Marketing Committees (APMCs) established by state governments. The Standing Committee on Agriculture (2018) observed that small and marginal farmers face various issues in selling their produce in APMC markets such as inadequate marketable surplus, long distance to nearest APMC markets, and lack of transportation facilities. Most farmers lack access to government procurement facilities including APMC markets.

40. Statement I: CORRECT—This type of farming is still practised in few pockets of India. Primitive subsistence agriculture is practised on small patches of land with the help of primitive tools like hoe, dao and digging sticks, and family/community labour. This type of farming depends upon monsoon, natural fertility of the soil and suitability of other environmental conditions to the crops grown.

Statement II: CORRECT—It is a ‘slash and burn’ agriculture. Farmers clear a patch of land and produce cereals and other food crops to sustain their family. When the soil fertility decreases, the farmers shift and clear a fresh patch of land for cultivation. This type of shifting allows nature to replenish the fertility of the soil through natural processes; land productivity in this type of agriculture is low as the farmer does not use fertilisers or other
