

16. The polar-fleeing force relates to the rotation of the earth. The earth is not a perfect sphere; it has a bulge at the equator. This bulge is due to the rotation of the earth. [Greater Centrifugal force at the equator. Centrifugal force increases as we move from poles towards equator. This increase in centrifugal force has led to pole fleeing]. Wegner believed that this force, among others, is a force acted upon landmasses to drift. But has been proved that these forces have limited impact on movement of land masses.

    Distribution of fossils of same species across different land masses is an evidence of drift. The observations that Lemurs occur in India, Madagascar and Africa led some to consider a contiguous landmass “Lemuria” linking these three landmasses.

17. The correct combination is
    1. Nebular Hypothesis - Immanuel Kant
    2. Convectional Current Theory - Arthur Holmes
    3. Sea Floor Spreading - Harry Hess

18. The first two are evidences of Sea Floor Spreading while the third is an evidence of continental drift.
