49. There are many minor tectonic plates. Some minor plates of importance are
    1. Cocos plate: Between Central America and Pacific plate
    2. Nazca plate: Between South America and Pacific plate
    3. Arabian plate: Mostly the Saudi Arabian landmass
    4. Philippine plate: Between the Asiatic and Pacific plate
    5. Caroline plate: Between the Philippine and Indian plate (North of New Guinea)
    6. Fuji plate: North-east of Australia
    7. Turkish plate
    8. Aegean plate (Mediterranean region)
    9. Caribbean plate
    10. Juan de Fuca plate (between Pacific and North American plates)
    11. Iranian plate
50. Volcanic landforms are divided into extrusive and intrusive landforms based on weather magma cools within the crust or above the crust. Rocks formed by cooling of magma within the crust are called Plutonic rocks. Rocks formed by cooling of lava above the surface are called Igneous rocks. In general, the term 'Igneous rocks' is used to refer all rocks of volcanic origin.
51. After the eruption of magma has ceased, the crater frequently turns into a lake later. This lake is called a 'caldera'. Lake Toba, Indonesia, the largest volcanic crater lake in the world, Crater lake in Oregon, USA. Lonar in Maharashtra are examples of meteor crater lake and not volcanic caldera.
52. The Mariana Trench or Marianas Trench is in the western Pacific Ocean about 200 kilometres (124 mi) east of the Mariana Islands; it is the deepest trench in the world. The maximum known depth is 10,984 metres (36,037 ft) (± 25 metres [82 ft]) at the southern end of a small slot-shaped valley in its floor known as the Challenger Deep. By comparison: if Mount Everest were placed into the trench at this point, its peak would still be over two kilometres (1.2 mi) under water. The Mariana Trench is part of the Izu-Bonin-Mariana subduction system that forms the boundary between two tectonic plates. In this system, the western edge of one plate, the Pacific
