Also, there are gross inequalities between basins and geographic regions.

62. Statement I: CORRECT—Most poor people in India live in rural areas. They belong to socially weaker sections and have few or no assets. They work as agricultural laborers and are dependent upon wage earnings for their subsistence. The latest available data show that in 2011 there were about 144 million agricultural laborers, about 62 million of whom were female. These men and, especially, women are the subject of inclusive growth programs in rural areas and are a priority to benefit from inclusive growth.
Statement II: INCORRECT—The rural employment guarantee scheme, the Mahatama Gandhi National Rural Employment Guarantee Act (MNREGA) is an elaborate program to address the needs of the rural poor.

Under the program, 100 days of employment are guaranteed to at least one member of the household, and about one-third of the opportunities are reserved for women. In FY2015-2016, more than 13 billion person-days of work were provided under the scheme, 7.7 billion of which were taken up by women workers.

63. Statement I: CORRECT—Soil fertility is generally defined as “ability of soil to supply plant nutrients”. Soil structure, soil texture, temperature, water, light and air also play an important role in maintaining soil fertility. Plant nutrients which are often scarce in soil are nitrogen, potassium and phosphorus since plants use large amounts for their growth and survival.
Statement II: CORRECT—There are chemical elements in the organic matter, which are extremely important, especially in their relation or proportion to each other. They are Carbon and Nitrogen. The relationship is called Carbon - Nitrogen Ratio (C:N Ratio). For example, composed manure has 20:1 and sawdust has 400:1 of carbon and nitrogen.

64. Statement I: CORRECT—Higher crop yields and quality of the crops depend largely on the efficient supply of nutrients. Soil provides not only the medium but also functions as the source of these nutrients for the plants. Soil resources get depleted with every harvest and need to be replenished for every crop. However, one must know which nutrients are to what extent
