reach the other end of the rocks to create the effect of a window—thus forming a wind window. Window bridges are formed when the holes are further widened to form an arch-like feature.

57. Original or Tectonic mountains are the product of tectonic forces. The tectonic mountains may be categorised into fold mountains (Himalayas, Rockies, Andes, etc.), block mountains (Vosges mountains in France, Black Forest in Germany, Vindhya and Satpuras in India etc.) and volcanic mountains (Cascade Range in USA, Mount Kenya, Mount Kilimanjaro, Mount Fujiyama, etc.). Circum-erosional or Relict or Residual mountains (Aravalis in India, Urals in Russia, etc.) are the remnants of old fold mountains derived as a result of denudation [strip of covering or possessions; make bare].

58. **Some Examples of Metamorphism**

$$\text{Granite} \xrightarrow{\text{Pressure}} \text{Gneiss}$$

$$\text{Clay, Shale} \xrightarrow{\text{Pressure}} \text{Schist}$$

$$\text{Sandstone} \xrightarrow{\text{Heat}} \text{Quartzite}$$

$$\text{Clay, Shale} \xrightarrow{\text{Heat}} \text{Slate} \xrightarrow{\text{Heat}} \text{Phyllite}$$

$$\text{Coal} \xrightarrow{\text{Heat}} \text{Anthracite, Graphite}$$

$$\text{Limestone} \xrightarrow{\text{Heat}} \text{Marble}$$

59. Though basaltic rocks can be found in all the abovementioned seas, Baltic sea has no evidence of volcanos and the basaltic rocks found in Baltic sea are transported by glacier.

60. Sedimentary rocks consist of a number of layers or strata and are characterised by marks left behind by water currents, waves, etc. These rocks have fossils of plants and animals and are generally porous and allow water to percolate through them.

61. Divergent boundary played a key role in forming new seas and oceans in continental drift alongside creating new continents. Ninety percent of Earth's longest mountain ranges are under ocean and most of them were created by Divergent Boundary interaction, which is also called as constructive edge.

Difficulty Level: Tough
