polluting industries. The important factor in their location is accessibility by road network.

3. Modern manufacturing is characterised by:

   i. A complex machine technology
   ii. Extreme specialisation and division of labour for producing more goods with less effort, and low costs
   iii. Vast capital
   iv. Large organisations
   v. Executive bureaucracy

4. It is the smallest manufacturing unit. The artisans use local raw materials and simple tools to produce everyday goods in their homes with the help of their family members or part time labour. Finished products may be for consumption in the same household or, for sale in local (village) markets, or, for barter. Capital and transportation do not wield much influence as this type of manufacturing has low commercial significance and most of the tools are devised locally.
5. Large scale manufacturing involves a large market, various raw materials, enormous energy, specialised workers, advanced technology, assembly-line mass production and large capital. This kind of manufacturing developed in the last 200 years, in the United Kingdom, north-eastern USA and Europe. Now it has diffused to almost all over the world.

   On the basis of the system of large scale manufacturing, the world's major industrial regions may be grouped under two broad types, namely:

   i. traditional large-scale industrial regions which are thickly clustered in a few more developed countries.
   ii. high-technology large scale industrial regions which have diffused to less developed countries.

6. Public Sector Industries are owned and managed by governments. In India, there were a number of Public Sector Undertakings (PSUs). Socialist countries have many state owned industries. Mixed economies have both Public and Private sector
