

68. P-waves are first to be recorded on seismograph and L-waves are most destructive because of high amplitude and transverse vibrational nature. Both S-waves and L-waves are transversal and P-waves are longitudinal or compressional waves. Both P-waves and S-waves are of high frequency whereas L-waves are low frequency waves.

69. Since S-waves cannot travel through liquid, they do not pass through the liquid outer core thus form greater shadow zone than that of P-waves which can travel through all three mediums.
