

79. Heat within the earth comes from two main sources: **radioactive decay** and **residual heat**. Arthur Holmes first considered this idea in the 1930s, which later influenced Harry Hess' thinking about seafloor spreading. Major geomorphological features such as fold and block mountains, mid-oceanic ridges, trenches, volcanism, earthquakes, etc., are a direct consequence of interaction between various litho- spheric plates.

80. Indian Plate collided Asia around 40 to 50 million years ago. Then, part of the Indian landmass began to go beneath the Asian plate, moving the Asian land- mass up, which resulted in the rise of the Himalayas. The mountain range grew very rapidly in comparison to most mountain ranges, and still growing today. The continued growth in the Himalayas is likely due to the Indian tectonic plate still moving slowly but surely northward.

81.

1. Major part of the boundary between African plate and North American plate is divergent boundary.
2. Major part of the boundary between Arabian plate and African plate is transform boundary.
