96. Neutral shorelines are those which come into existence neither due to emergence or submergence. These are formed by the building of the land into the sea. The word 'neutral' implies that there need be no relative change between the level of sea and the coastal region of the continent. Neutral coastlines include the alluvial fan shaped coastline, delta coastline, volcano coastline and the coral reef coastline.

Explanation (93)

97. Estuaries (delta at submerged mouth of river) and Cuspate (pointed delta) are different types of deltas formed by river.

If fluvial erosion of a stream at the shore does not match the retreat of the sea, the rivers appear to be hanging over the sea. These valleys are called hanging valleys.

Deposited material carried by streams entering plains from mountains deposit in conical shape, which is called Alluvial Fan or Cone.

98. A rift lake is a lake formed as a result of subsidence related to movement on faults within a rift zone, an area of extensional tectonics in the continental crust. Dead Sea basin is a consequence of a "step-over" discontinuity along the Dead Sea
