Statement 2 explains that if use of nitrogen fertilizer is in excess, then acidity in soil tends to increase, which is correct. Statement 3 describes that nitrogen fertilizer on breaking into nitrates will result in emissions of nitrous oxides from soil that travels through soil. As being water-soluble, it is available in groundwater causing certain effects, hence it is correct. Since both statements 2 and 3 are correct, so option (c) is correct.

4. Cabinet Committee on approval from Economic Affairs approves Fair and Remunerative price of sugarcane that needs to be paid by sugar mills during particular sugar season which is fixed for one quintal. Once the approval is received their result in guaranteed price for cane growers, hence option (a) is correct. In option (b), Commission for Agricultural Costs and Prices will recommend fair and remunerative prices as per inter-crop price parity, inflation and return for farmers, so it is incorrect. Option (c) is incorrect as Directorate of Marketing and Inspection will cater all agricultural and allied produce marketing activities in the country which will save the interest of producers, sellers and consumers. Agricultural produce market committee save farmers from money lenders to sell their produce at required rates and further monitors food produce to be sold through market yard and not directly to money lenders, so this option is not correct.
5. The Equatorial Counter Current occurs near the equator describes eastward moving wind current which is 10-15m deep that is driven by distinct surface wind pattern in tropics. It is found that strong westward winds result in westward surface flow which occurs several hundred kilometres north of equator. Option (b) is correct as equatorial counter-current phenomenon near the equator shows eastward flow of oceanic water that opposes and flanked by westward currents. Option (a) is incorrect as eastward flow of the equatorial counter-current is not concerning with Earth rotation on its axis as it is an imaginary line which is passed through North and South Poles. Option (c) is also not related as Salinity is amount of salts in water and is nothing to concern with ocean current. Occurrence of the belt of calm near equator is a region where trade winds from north and south converges and creates a
