SATELLITE INTERNET—WIRELESS INTERNET BEAMED DOWN FROM SPACE—IS AN EFFECTIVE ALTERNATIVE FOR COMMUNICATION AND BROADBAND SERVICES IN REMOTE AREAS

Satellite internet is a lot different from land-based internet services. A wireless internet beamed down from satellites orbiting the Earth, it is location-agnostic and can be accessed from anywhere within the range of satellites. Since it is the only internet service available across the country, satellite internet is the only way for many rural homes and businesses to get online. It works by using radio waves to communicate with satellites orbiting the Earth. Data is sent and retrieved through a communication network that starts with your device and travels through your modem and satellite dish, out to a satellite in space, then back to Earth to ground stations known as network operations centres (NOCs) from where it connects back to your devices. The satellites rotate with the planet (geostationary orbit), which helps keep the signal relay consistent.
