INDIA@100 | DEFENCE
CYBER SECURITY

TO BUILD A FIREWALL

WHILE THE COUNTRY AS A WHOLE HAS MULTI-LEVEL CYBER SECURITY, OUR ARMED FORCES NEED A MORE ROBUST SYSTEM TO SAFEGUARD AGAINST SECURITY BREACHES BY ENEMIES SUCH AS CHINA

As malevolent throngs of hackers try to break through sensitive digital repositories of the Indian defence ministry, they are repelled by advanced cyber security—incident preparedness and response planning, dictated by a response playbook, and overseen by highly trained staff. But to make such a scenario real in the near future, India will have to walk in the path of determined defence. Adoption of future cyber security methods that can block malware with polymorphic characteristics (which change their features to hide from detection software) with ease is vital. However, currently, cyber security—a set of methods and technologies aimed at protecting network systems, data and programmes from attacks, theft and illegal access by hackers and cybercriminals—has gained utmost importance. The situation is grim: a single security breach can lead to the leak of personal information of millions of people and crores of rupees in financial losses. Cyber security protects nuclear sites, banks, electricity plants, hospitals and many other valuable installations that use digital infrastructure. Cyber security identifies and fixes malicious attacks and prevents them from happening. In an
