financial situation and risk profile to offer more profitable loan terms, even as it helps the latter have a better understanding of their finances before taking on any debt.

In e-commerce, open banking enables shoppers to directly pay merchants from their bank account, with the payment facilitated by a third party. Since these open banking payments go directly from the shopper's to the merchant's account, without going through credit card networks or other intermediaries, the transfers can be executed instantaneously or in 'real time'. Such real-time payments (RTPs) are made possible by a digital infrastructure that is online 24x7 with end-to-end communication.

WHAT INDIA NEEDS TO MASTER

Open banking is in a nascent stage in most parts of the world. To give it a push back home, the Reserve Bank of India (RBI) unveiled the account aggregator (AA) network in September 2021. It helps an individual securely and digitally access and share information from any financial institution where they have an account with another regulated financial institution in the AA network. As of December 2022, 94 institutions have been onboarded.

Going ahead, Indian banks need to focus on revamping their integration platform to swiftly and securely interact with a host of third-party providers. For that, they should start thinking beyond their existing boundaries, shed concerns and develop new partnering capabilities. ■
