How to de-stress your child

Is your child showing signs of academic stress? Mumbai-based psychologist HIRAK PATEL has tips on how to handle the crisis

Exercise

Physical fitness impacts academic outcomes. Some daily movement and exercise are highly recommended

Regulate sleep

Reduce screen time for children at night so that they can have a regular and sufficient sleep cycle

Manage diet and nutritional profile

A healthy and balanced diet improves mood and also helps in cognitive development

Seek professional advice

If there are signs of serious distress, children should be introduced to a counsellor for professional support

Focus on positive experiences

Meeting friends, family meals and recreational time are some examples of how a positive atmosphere can be created at home

bai, says, "Nothing can replace the human touch—the physical presence of a teacher in a classroom full of students." It was, therefore, just a matter of time before the gaps started showing in learning outcome studies. The Unicef survey, for instance, revealed that nearly 75 per cent of parents of 5-to 13-year-olds with access to digital devices said their children had been learning less than in physical classroom settings; likewise, 80 per cent students between the ages of 14 and 18 reported lower levels of learning when education went online. Researchers at the Azim Premji University, in a 2021 survey of 16,067 children in Classes 2-6 in 1,137 government schools in five states, found that 92 per cent of the students on an average had lost at least one specific language ability and 82 per cent at least one specific mathematical ability over the previous years. The latter included identifying single- and two-digit numbers, performing basic arithmetic operations
