that even diabetics can have them in moderation, says Dr Samaddar. "Fruits build immunity, help you stay hydrated and are a rich source of vitamins and minerals," says Sushma P.S., chief dietitian at Jindal Naturecure Institute, Bengaluru. "Incorporating a wide variety of fruits in your diet ensures you receive a diverse range of these vital nutrients." Fruits like banana, mango and chikoo may have a sugar content relatively higher than others but can reduce cravings for the unhealthier cakes, cookies and puddings. Again, berries like strawberry, blueberry, blackberry and gooseberry have additional nutrients that can reduce the risk of cancer.

Given that there is a new superfood every day, imports of foods perceived as healthy have seen a significant rise. So, the imports of avocados were up 70 per cent in value terms between April and August this year compared to the same period last year, those of shelled almonds doubled, while those of pistachios and olives went up by 80 per cent and 60 per cent, respectively, going by commerce and industry ministry data.

However, if you find these imported foods expensive or not easily available, experts recommend that you eat what is locally available. "Seasonal fruits and vegetables are good for the body," says Dr Samaddar. "In the summer, you find fruits and vegetables naturally high in water content while in winters, you have immunity-boosting spinach and mustard leaves." Acharya feels similarly. "Instead of eating a vegetable that has been flown across the world, you can get equal if not more benefits eating the ones from your backyard," she says.
