Eternal Hospital, Jaipur

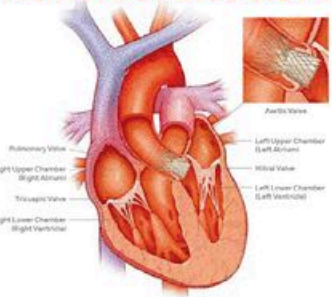

DR. AMIT CHAURASIA
Director - TAVI & Structural
Heart Disease Program

HIGHLY EXPERIENCED STRUCTURAL HEART TEAM AT ETERNAL HOSPITAL, JAIPUR WITH

3800+

TAVI PROCEDURES COLLECTIVELY WITH UTMOST SAFETY.

"Phenomenal",it aptly describes the TAVI procedure wherein a new valve is inserted by going from one of the leg artery and is positioned inside the old valve. This valve is a tissue valve and requires blood thinner for few months only. The main advantages of TAVI are no open heart surgery, shorter hospital and ICU stay and better quality of life.

68 year old patient was suffering from shortness of breath on minimal activity and was diagnosed with severe Aortic Stenosis. She also had kidney problem and already had an open heart surgery in the past for blockages. As she was at a high risk of undergoing open heart surgery for the second time, the only therapy which could help her was aortic valve replacement. Aortic stenosis refers to narrowing of aortic valve. Aortic valve permits the flow of blood from heart to the rest of the body and if gets narrowed the out flow is obstructed. Patient develops shortness of breath, chest discomfort and blackouts.

Medicines may not work in severe symptomatic aortic stenosis. If the above patient was to be managed with medicines her chances of survival in the first year was only 50% and 20% at two years.

She underwent Trans-catheter Aortic Valve Replacement (TAVI) wherein her aortic valve was replaced by catheter technique and without open heart surgery. Patient was discharged on fourth day. As her husband described the treatment

30-40% patients of severe aortic stenosis do not receive surgery due to fear or high risk during open heart surgery so TAVI offers new hope to these patients. It is a well tested therapy and has received FDA approval for treatment of any/all risk types of aortic stenosis in the patients. With coming of this therapy to India, patients with severe aortic stenosis will have improved survival and better quality of life with TAVI. More than 90 percent of TAVI cases are done with a needle puncture in groin and only this entry point is made numb while the patient remains awake. This assures minimum ICU stay and early discharge from the hospital.

Highly experienced structural Heart team under the guidance and mentorship of **Dr Ajeet Bana** - Chairman Cardiac Sciences & President EHCC Network performs TAVI or surgical procedures with utmost safety.

Eternal Centre For Valve & Structural Heart Disease

*** Aortic Stenosis * Mitral Stenosis * Mitral Regurgitation**
*** Pulmonary Valve Disorders**
