

MG & IIMPACT with girl children as part of the MG Sewa initiative to help with their education so that they get better jobs and opportunities in the future

"Prerna" is a one-year skill development initiative aimed at training 100 underprivilidged women to help them develop financial stability

in all aspects of its business and integrated 37 per cent of women employees in its workforce including the factory and aims to increase this number to 50 per cent by December 2023. Many initiatives are also part of MG's efforts including Drive Her Back, Genesis, Neem, MG Changemakers, Womentorship and Worth Waiting For. One such initiative that stands out is MG Sewa. Sewa translates to "selfless service" and apt for what MG is doing for the communities in and around Halol and Gurgaon. Under this initiative, the organization encourages women empowerment and girl child education to create an equitable pool of opportunities.

MG also believes that India is a land of enormous talent and it can help nurture it through such services for this talent to achieve its maximum potential. Skill development then becomes vital to nurture such talent. To support skill development and empower the youth of India, MG contributes in educational development like collaborating with IIT Delhi by donating a ZS EV to help the institute in research and development of future electric vehicles. The company has also partnered with Automotive Component Manufacturers Association of India (ACMA) and launched Project Dakshata in collaboration with Automotive Skill Development Council (ASDC) and Autobot India to educate

and foster skill development in the EV & AI industry.

Apart from MG's social initiatives, the company is also focused towards environmental responsibilities which extend beyond just manufacturing zero emission electric vehicles. Part of the process is reducing the company's carbon footprint. MG became the first passenger car company in India to adopt wind and solar hybrid energy when it partnered with Clean Max Enviro Energy Solutions Pvt. Ltd. for the supply of 4.85mW to the brand's plant in Halol, saving approximately 2 lakh metric tons of CO2 over 15 years. The brand uses low-temperature Phosphate (VERSABOND) which saves 325 tons of CO2 per annum and high-throw low-cure cathodic-electro coating paint which results in a reduction of 388 tons of Carbon Dioxide per annum. All these measures add up to a cumulative CO2 reduction of 1,500 tons per annum, a huge feat in ensuring a better environment for the future.

Clean EV technology promising zero emissions still comes with environmental concerns over used batteries but MG has been thinking ahead in this regard too. MG supports end-to-end sustainability for electric vehicles, and has in the process partnered with Umicore and Tes AMM for disposal of EV batteries and Exicom and Tata Power for second life use. A partnership with Attero has seen the brand recycle its first EV battery. MG Motor goes to great lengths to develop a complete ecosystem around the company's primary objective of manufacturing cars by taking up social and environmental responsibilities to ensure a cleaner present and a brighter future for everyone.
